

Please upload your progress report to the Github repo shared on CMT. The progress report should give us an idea of how you're implementing your proposal. It should answer 3 main questions: 1) Which tasks have been completed? 2) Which tasks are pending? 3) Are you facing any challenges?

1. I set up a docker container to train a tensorflow recurrent neural network for the text classification competition. So far the best tf1 I got is around 0.69, which is about 0.03 away from the baseline.
2. Need to work on improving the model to beat the baseline and create a video and documentation on running the model.
3. Improving the model is easy, and takes a lot of trial and error.
